

# IVIS Discovery Process of D3 Data

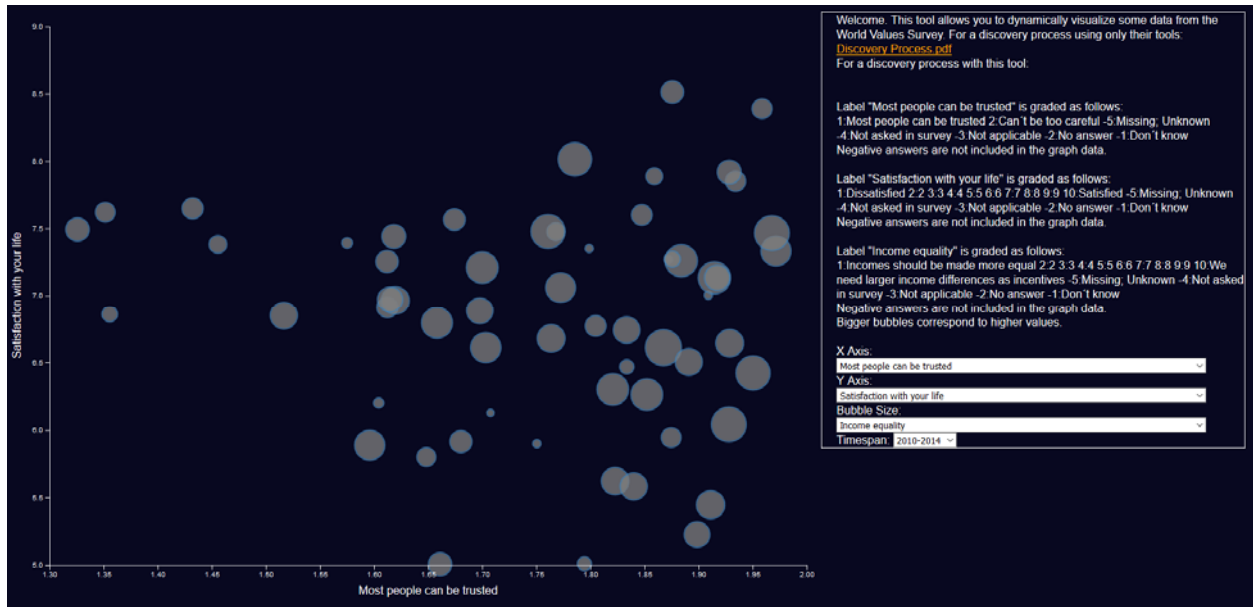

World Values Survey data was harvested. An interface for filtering it was built in D3.js, from which the following visualizations were made. The research question: how do religious beliefs correlate with others?

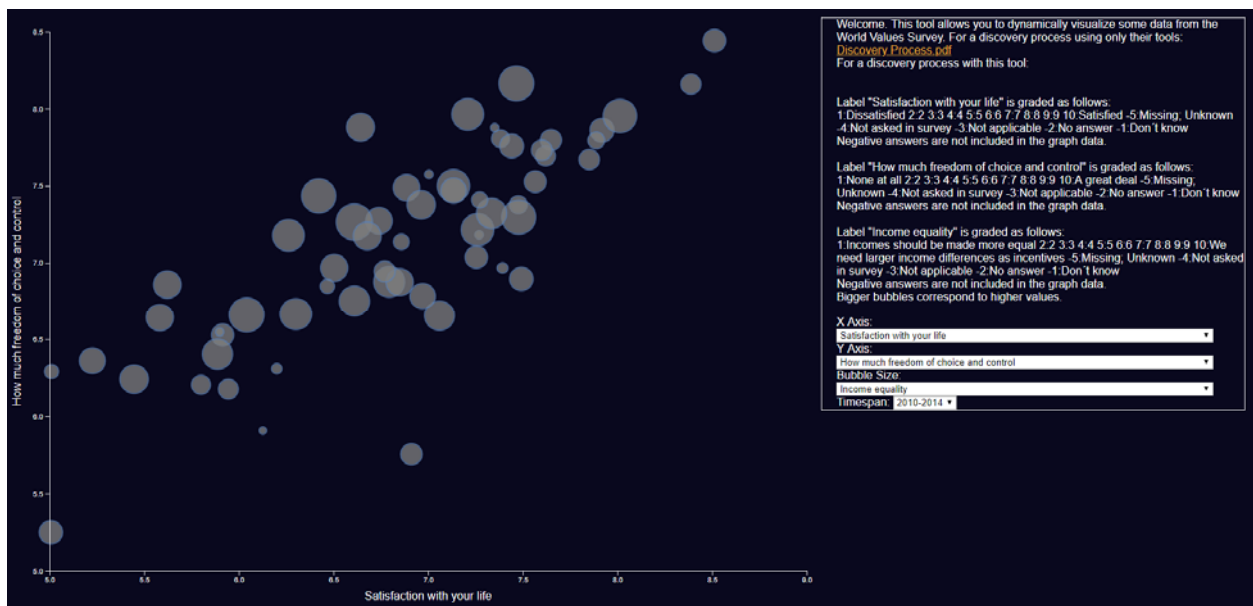

A belief in god did not appear to correlate with satisfaction in life.

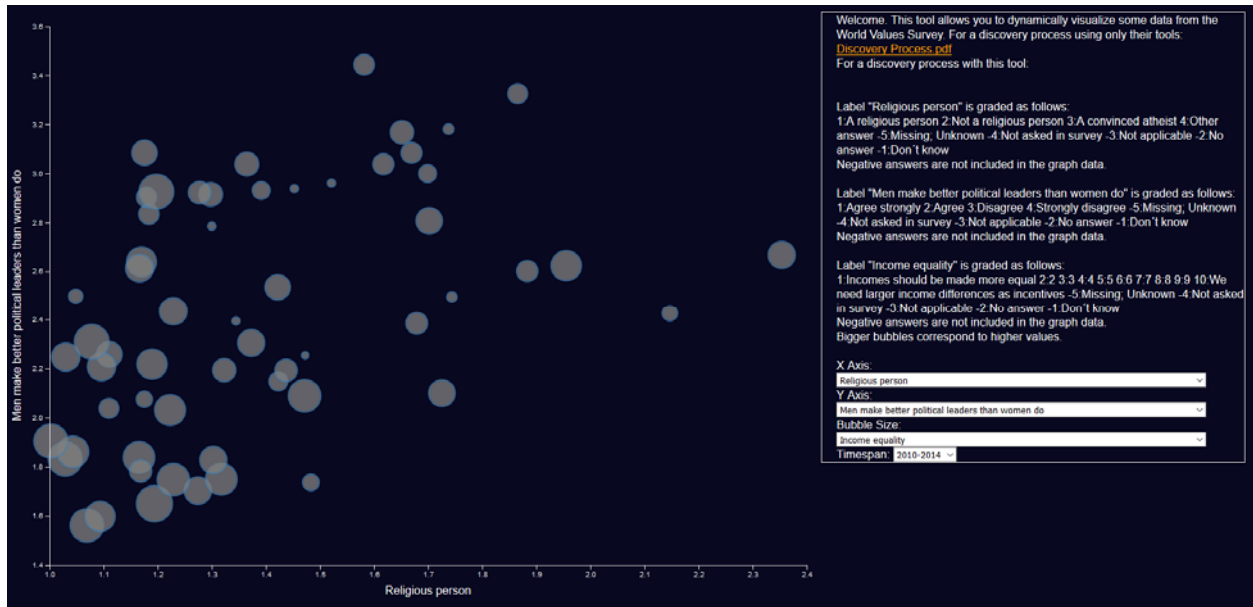

Self-reported religious people do however trust others somewhat more, it appears.

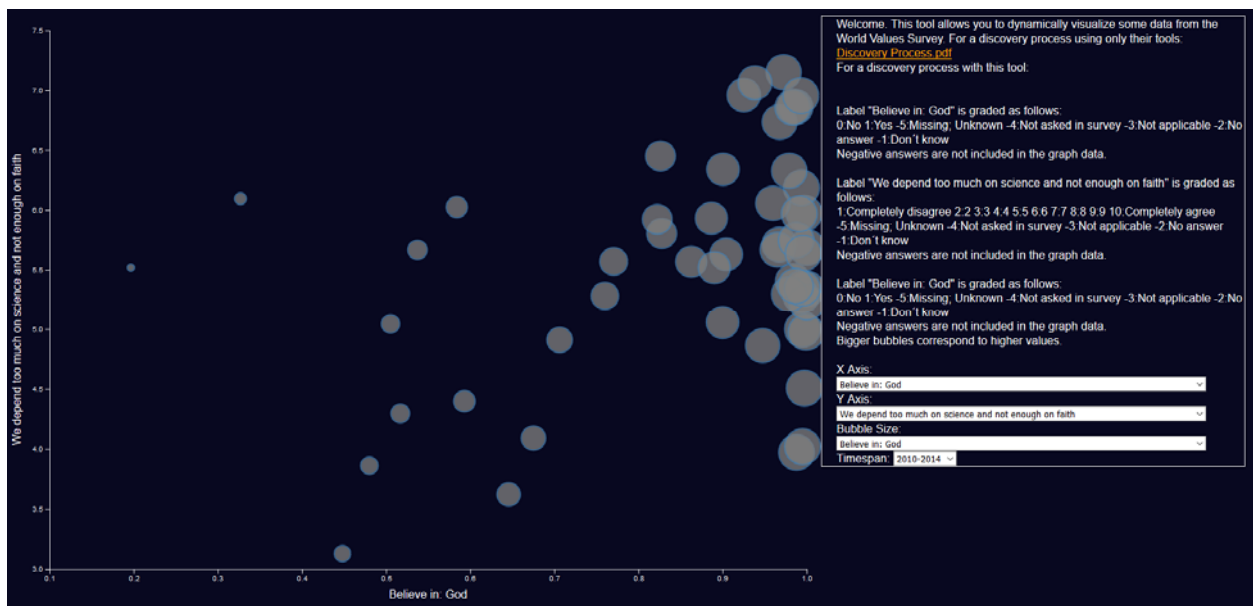

Comparing the previous variables, trust in others does not seem to equate to life satisfaction.

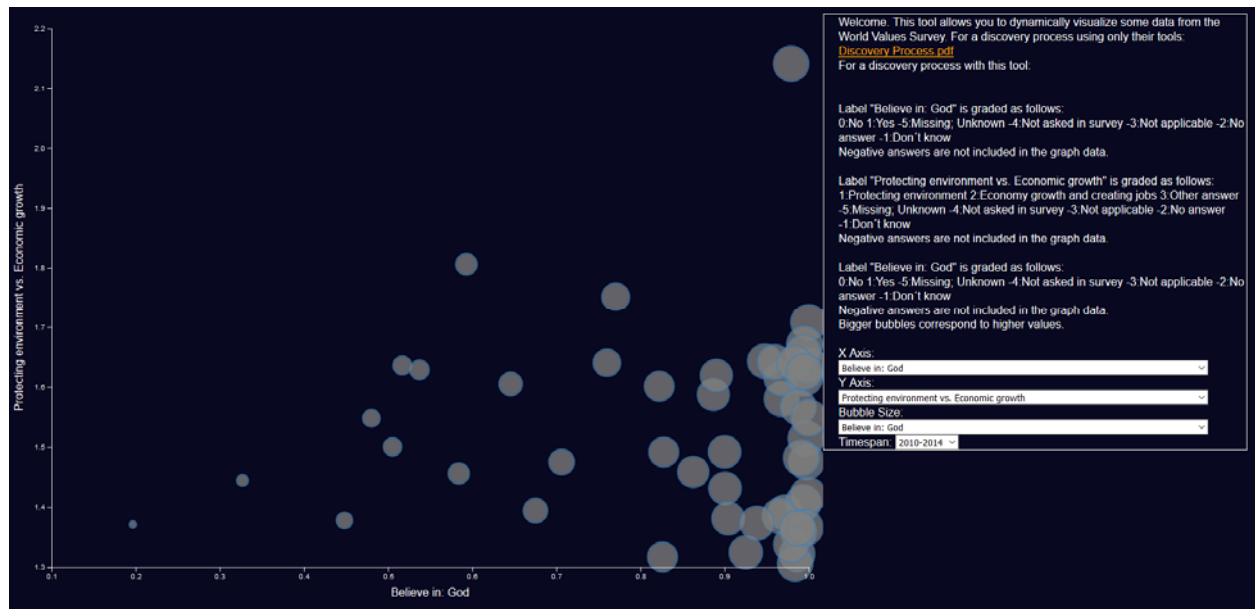

As an aside, having a sense of control in life does correlate strongly with life satisfaction.

Religious beliefs appear to correlate to thinking men make for better political leaders.

A belief in god does not appear to correlate to feeling that we depend too much on science over faith.

Nor does it equate to valuing ecology over economy.
