

IVIS Discovery Process of WVS Data

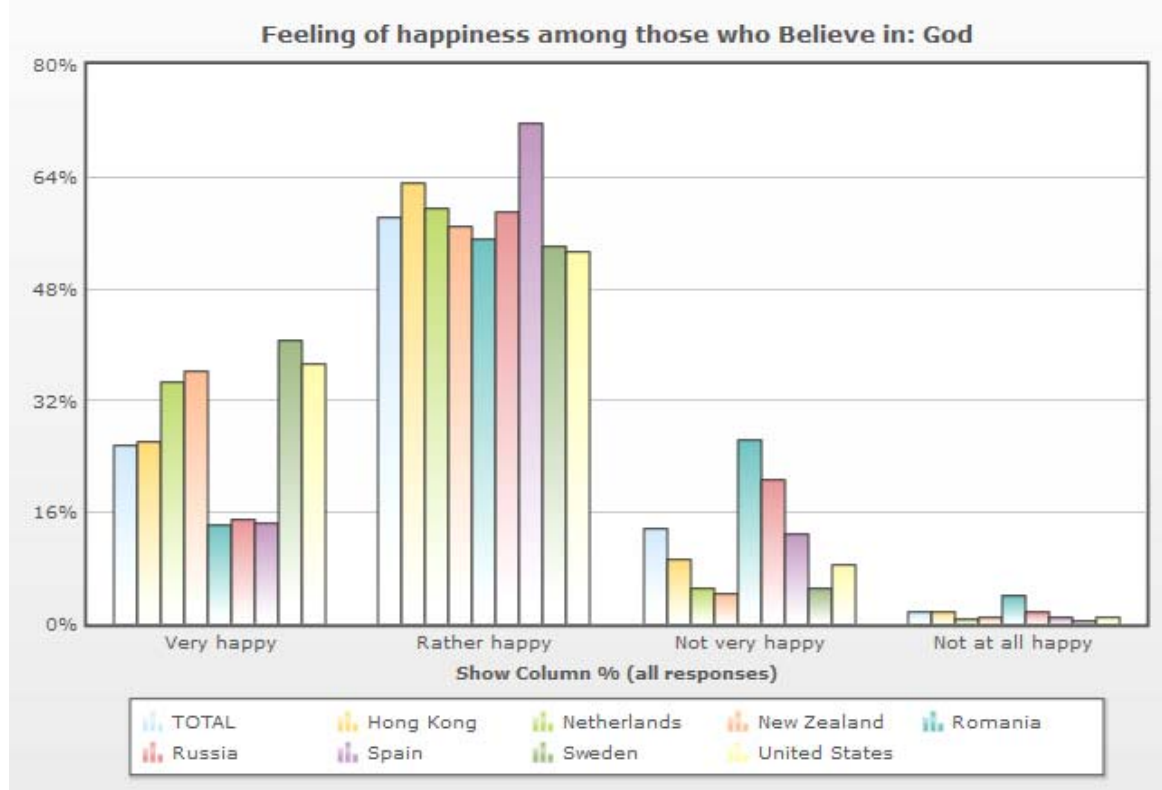

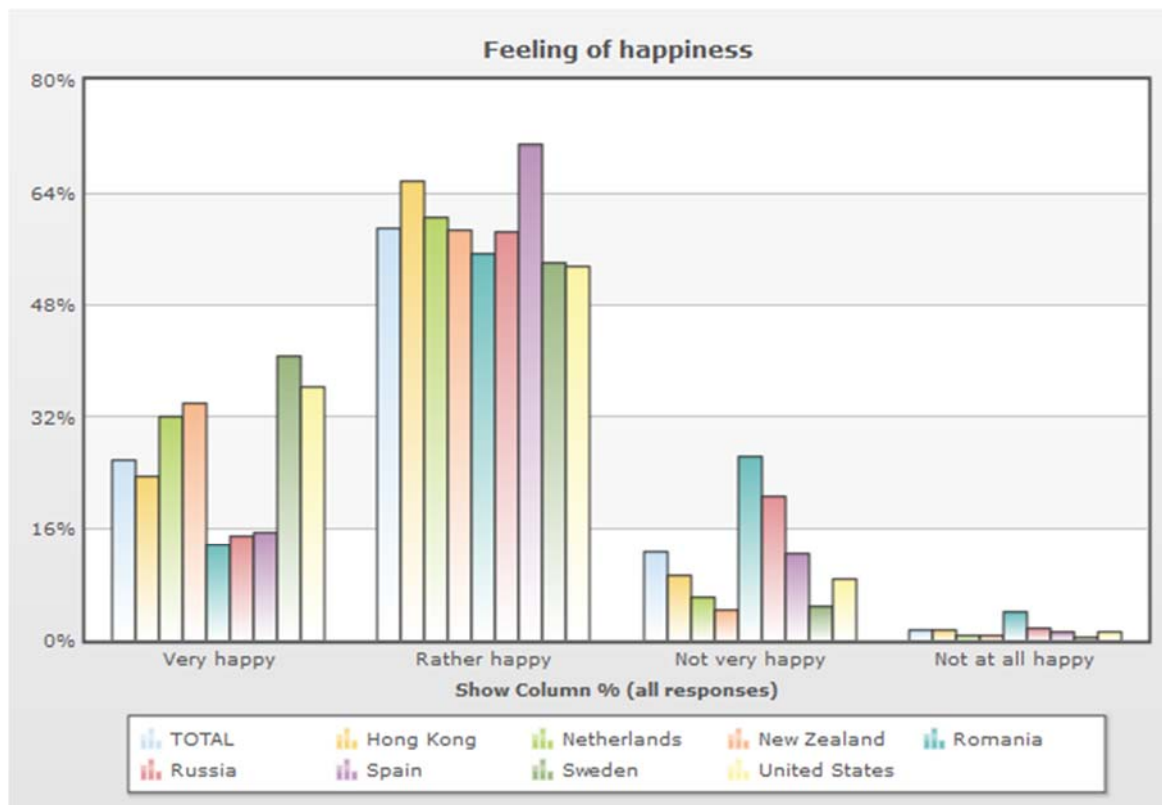

Eight predominantly western-style countries from around the world were selected to attempt to visualize the impact of faith on other beliefs.

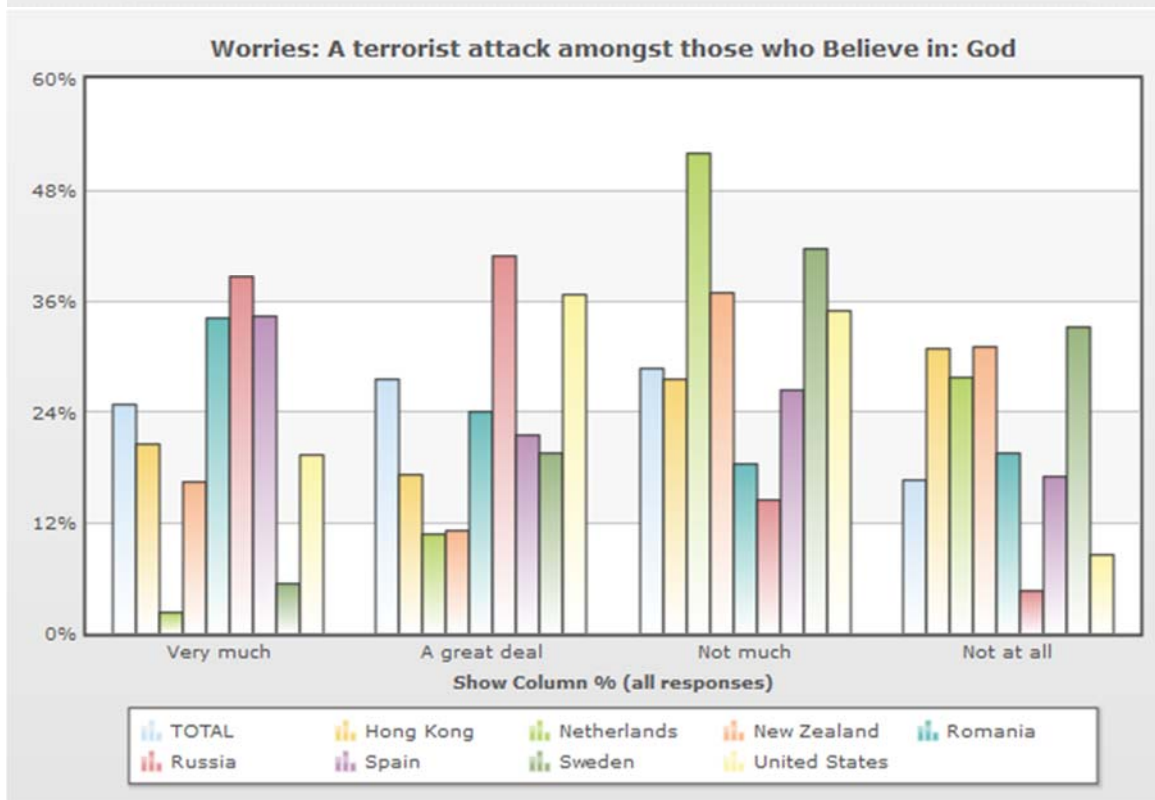

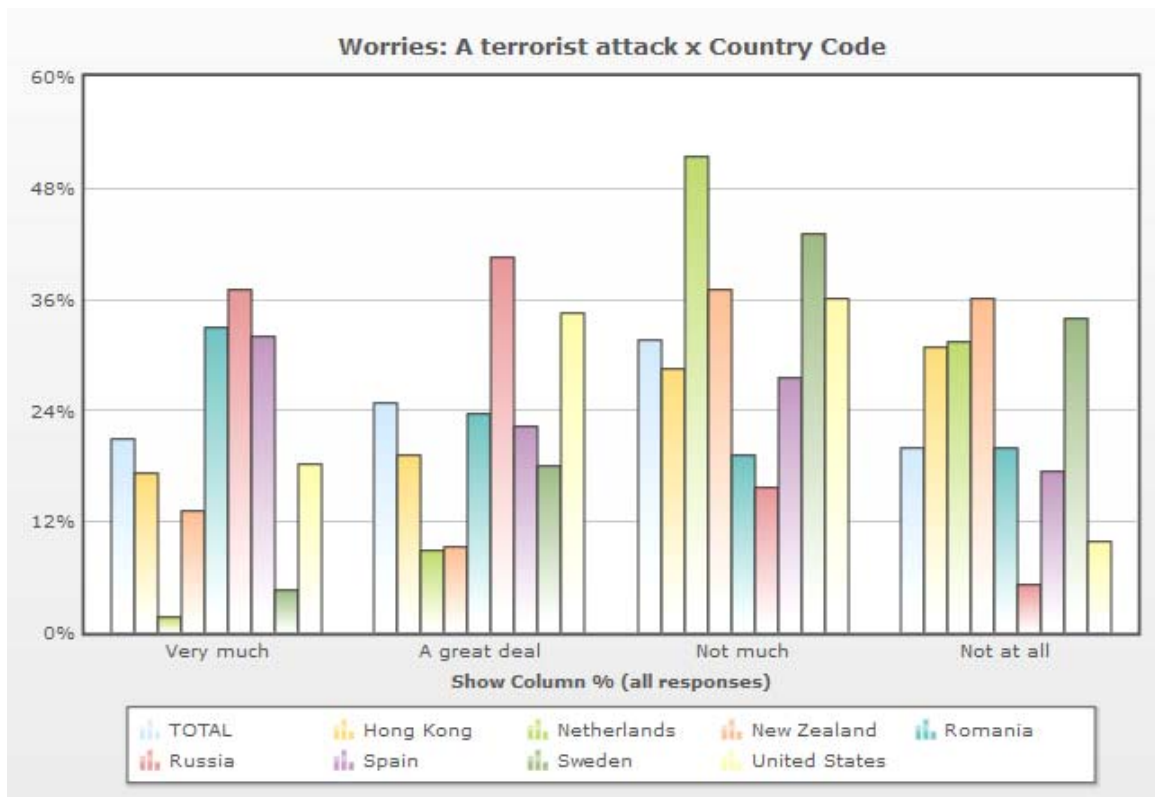

Basic religious beliefs in god and hell were mapped. Romania and the US stand out with a high portion of believers. The Netherlands and Sweden show relatively low degrees of belief.

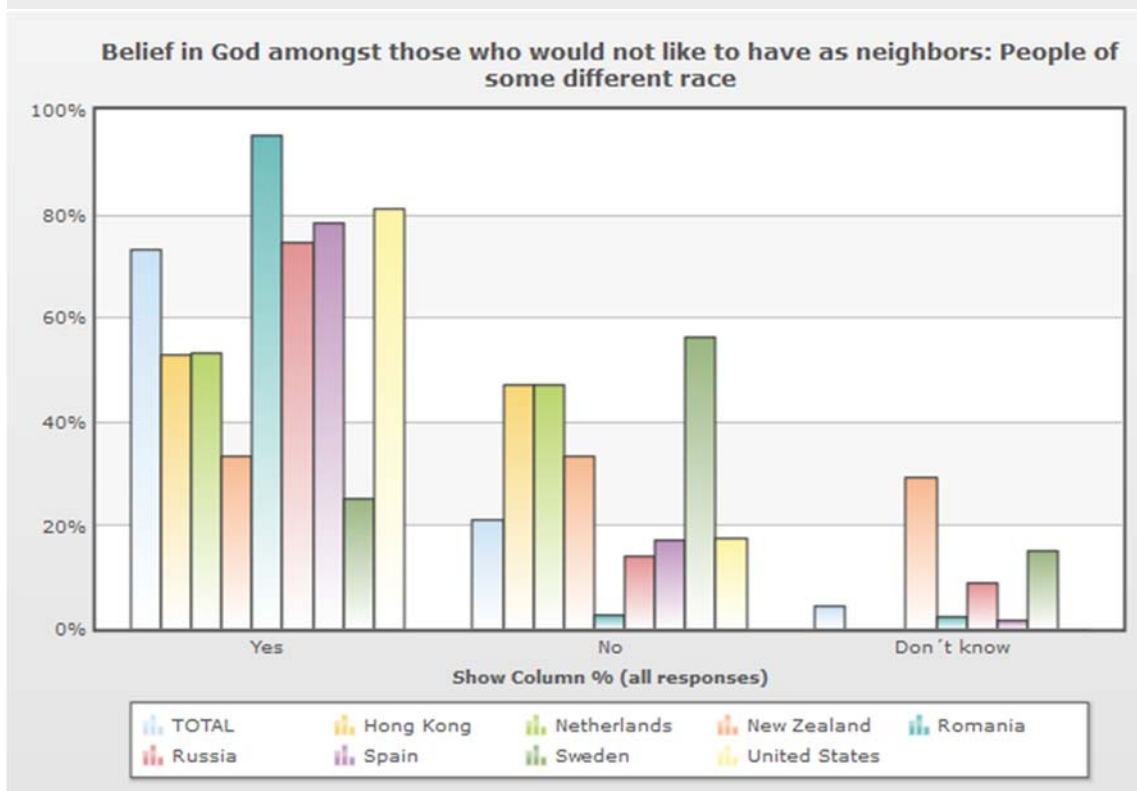

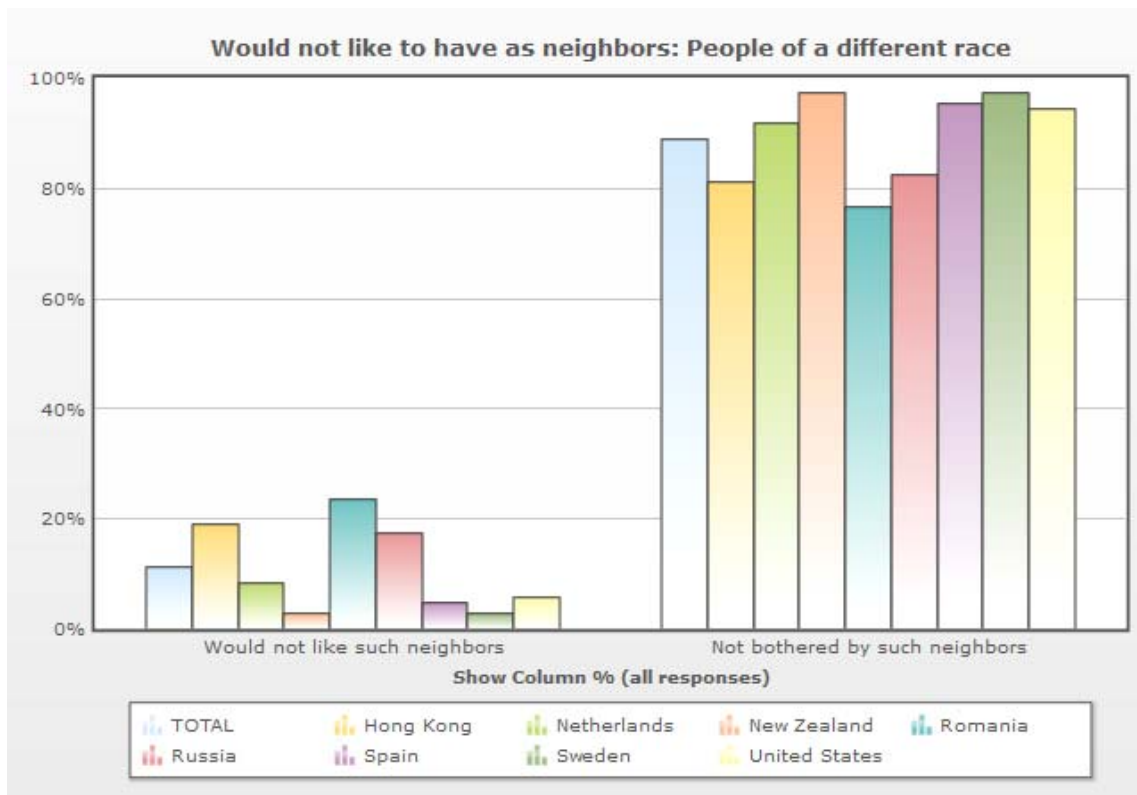

A belief in hell is predictably higher among those who believe in god.

Reported feelings of happiness, and the same for those who believe in god, was mapped. No increase appears evident.

Fears of terror attacks was mapped, and then compared to the same fear among those with religious beliefs. It appears several percentage points higher among believers.

Xenophobia was mapped, and the rate of belief in god among those who did not want neighbors of another race was examined. Compared to the rate of belief in god in the general sample, it's higher in total but lower for certain countries (e.g. the US).
